

1     **ABSTRACT OF THE DISCLOSURE**

2             A cargo lift for a vehicle has a motor, an upper stanchion, a lower  
3     stanchion, a platform, a platform bracket, a roller bracket, a mounting bracket,  
4     a wing and a platform storage device. The motor is connected to the upper  
5     stanchion, and the lower stanchion is mounted inside the upper stanchion. The  
6     wing is formed on the upper stanchion, and the mounting bracket is pivotally  
7     attached to the wing. The platform bracket is pivotally mounted on the lower  
8     stanchion, and the platform is attached to the platform bracket. The platform  
9     storage device mounted on the wing has an actuating arm and a spring-loaded  
10    holder. The spring-loaded holder has a compressed spring mounted inside a  
11    cylinder. When the cargo lift is assembled, the compressed spring mounted  
12    inside the cylinder prevents the compressed spring from releasing and injuring  
13    anyone. Furthermore, the cargo lift has a beautiful external appearance.
